focusing on mathematical methods in computer tomography image processing tensor transform and discrete tomography with matlab introduces novel approaches to help in solving the problem of image reconstruction on the cartesian lattice specifically it discusses methods of image processing along parallel rays to more quickly and accurately reconstruct images from a finite number of projections thereby avoiding overradiation of the body during a computed tomography ct scan the book presents several new ideas concepts and methods many of which have not been published elsewhere new concepts include methods of transferring the geometry of rays from the plane to the cartesian lattice the point map of projections the particle and its field function and the statistical model of averaging the authors supply numerous examples matlab based programs end of chapter problems and experimental results of implementation the main approach for image reconstruction proposed by the authors

differs from existing methods of back projection iterative reconstruction and fourier and radon filtering in this book the authors explain how to process each projection by a system of linear equations or linear convolutions to calculate the corresponding part of the 2 d tensor or paired transform of the discrete image they then describe how to calculate the inverse transform to obtain the reconstruction the proposed models for image reconstruction from projections are simple and result in more accurate reconstructions introducing a new theory and methods of image reconstruction this book provides a solid grounding for those interested in further research and in obtaining new results it encourages readers to develop effective applications of these methods in ct
